Paddington HEX Gateline

INFRASTRUCTURE PROJECTS

Due to the interface between Crossrail, Heathrow Express and Heathrow Airport the ticketing system and the infrastructure used to support it needed to be updated to better connect Heathrow Airport Terminals to London Paddington and the wider network

New Automated Ticket Gates (ATG's) and associated Ticket Vending Machines (TVM's) were required to serve the increased number of Oyster Card / Contactless Card users who pass through the stations on a daily basis. The aim was to improve customer satisfaction and provide a smooth journey through the station.

The works involved all the necessary infrastructure required to serve the new ATG's and TVM's and covered a number of disciplines. In addition to the direct installation of new equipment and removal of redundant equipment, the new system had to be connected to the communications network at London Paddington Station.

Dennis Mead receiving a MACE award for his proactive approach to Health & Safety

All works were undertaken by our skilled teams with minimal disruption to Heathrow Airport,

London Paddington and the passengers that use the infrastructure on a daily basis.
